

The basic objective of the United Nations Framework Convention on Climate Change (UNFCCC or FCCC) is

- (A) to stabilize the melting ice of Antarctic Ocean
- (B) to stabilize greenhouse gas concentration in the atmosphere at a level that would prevent dangerous anthropogenic interference with climate change
- (C) to reduce carbon emission
- (D) to stabilize the ozone layer depletion

Correct Answer: (B)

Explanation:

The main objective of the UNFCCC is exactly as stated in option (B) — to stabilize greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous human-induced (anthropogenic) interference with the climate system. This is directly from the text of the convention.
